COMPARATIVE TABLE

OF THE

PRINCIPAL ITINERARY MEASURES USED IN DIFFERENT COUNTRIES.

The French Toise = 2 Metres = 78 Inches, or 2 Yards 6 Inches British.
5280 Feet = 1 Mile, and 3 Miles = 1 League British.

BLACK'S SCHOOL ATLAS.

PREFACE.

The preparation of a Volume of Maps, designed especially for use in Education, is a task of which little need be said in the way of apology or explanation. It is one which, in a great measure, precludes the exercise of even that limited originality which belongs to the compilation of Maps on a large scale, and in which the newly-traced routes of an explorer, or the exact delineations of an experienced surveyor, may be for the first time laid down and accurately discriminated. The object in such a case as the present is restricted to the attempt to convey, within a small space, and in the most positive and methodical form, as much information as is consistent with that clearness and simplicity which the business of Education requires, and upon which it is well known mainly to depend for its successful influence upon the youthful mind. Yet, even within these narrow limits, it is believed that the present Volume will be found to offer some advantages over preceding works, and it will not be out of place briefly to direct attention to these, as they indicate the leading features of the plan which the Author has kept in view in its preparation.

The first requisite for such a work is *accuracy of detail*,—that is, not merely that general and comparative correctness which has been frequently considered as sufficient recommendation for works of this class, but such a positive and real delineation of the features of the Earth's surface, as fully comes up to the present state of geographical knowledge. However limited the scale of magnitude to which our Maps are restricted, still whatever they contain should be exactly of its right form, and in its proper place, and thus constitute the outlines of a system which the studies of after years may add to and expand, but of which the main features will remain substantially the same as those first implanted in the memory in youth.

But the chief difficulty to be encountered in preparing Maps, and one which bears an inverse ratio to the scale upon which they are constructed, lies in a due application of the critical knowledge which should discriminate between that which is of sufficient importance to render its insertion, even in a small Map, desirable, and perhaps necessary, and that which it is better to omit rather than incur the risk of sacrificing clearness by too minute an attention to detail. This is a difficulty of which the force will be adequately appreciated only by those who have themselves attempted to draw a Map, and which it requires no trifling amount of knowledge, and no little exercise of judgment and discrimination, to meet. A Map may be so crowded with names as to become obscure from its attempted fulness of information, and every one of the names may represent something which has real existence; and yet, from the want of judgment in its preparation, it may be almost useless as a guide to the student of history or geography, owing to the circumstance, that amongst the multitude of unimportant names are omitted those of places which are either the seats of manufacturing or commercial wealth and activity, or which have a permanent record in the pages of history, from having been the scenes of some of the great events of ancient or modern times. The real value of a Map, then, both to the teacher and the learner, consists not so much in the number of names it may be made to contain, as in the combination of a certain amount of information, limited by the considerations which have been adverted to, with the clearness and definiteness of character which are absolute and indispensable elements of its utility. While the Author of the present Volume has, throughout, had this object most distinctly and markedly in view, and has been guided in his efforts for its attainment by the results of considerable personal experience in education, he feels sensible that others may not entertain exactly the same views as himself with regard to the boundary-line between sufficiency and superabundance of detail; and if it should be thought that the limits of clearness have been in any instance over-stepped, he can only plead in excuse his anxiety that this collection of maps should serve as an adequate guide and companion in the study of the modern history and geography of our own country and the nations of Continental Europe. He is confident in the assertion that whatever it contains is the result of a careful and well-digested consideration of all existent materials, and will bear the test of comparison not merely with the ordinary school-books on Geography, but with the higher class of works on that branch of study which have appeared in recent times.

Equal regard has been paid to the correct delineation of the various features of Physical Geography, as to the names of towns and other similar localities, and the present Volume will, in this respect, be found to illustrate the actual

condition of the Earth's surface with more of fulness and accuracy than is done in many works of much higher pretensions. This quality is especially calculated to impart value to its use in Education, for Physical Geography forms the acknowledged basis of all kinds of Descriptive Geography, since the natural features of the earth exert an abiding influence over the division and distribution of nations, and have, in every country, given their strong impress to the pursuits, habits, and character of the inhabitants. In the delineation of the mountain-ranges it has, throughout, been the anxious desire of the Author to avoid the obscurity so often caused in maps by the too great prominence given to this feature; and, while paying minute regard to their form and direction, to keep the shading so light as not to interfere with the distinctness of the other features of the map.

Great attention has been paid to the Orthography, and it has been endeavoured to preserve more uniformity in the mode of writing Oriental and other foreign names than has hitherto been done in any connected series of maps. A valuable feature is likewise presented in the insertion, in addition to the *English* names of places, of those names by which they are known to the inhabitants of the countries in which they are respectively situated; for the numerous differences between these are the cause of difficulties to the learner, which are more frequent in proportion as the study of foreign languages and literature is becoming more general in our Schools. In such cases of diversity as Wien and Vienna, München and Munich, Livorno and Leghorn, Regensburg and Ratisbon, both names are written in the Map, and each is referred to under its proper alphabetical place in the Index; so that on consulting the latter the place will be found under whichever of the names it may be looked for.

It has seemed to the Author a highly desirable object to preserve, as much as possible, uniformity of scale in the Maps of adjacent countries, so that in referring from the one to the other, the mind may with correctness carry throughout the same ideas of relative magnitude and dimension, and the measurements which the eye readily becomes accustomed to make on the one map, without error, be applied also to the other. Owing to the great differences in the magnitude of various countries, the systematic accomplishment of this plan throughout the Work would, in a series of Maps designed for popular use, have been attended with some inconvenience; and it is manifestly unnecessary to delineate the frozen plains of Lapland or the barren steppes of Russia with the same degree of minuteness as the populous districts of the Netherlands, or the streams and valleys of Greece and Switzerland. But in the cases of France, Spain and Portugal, Germany, the Austrian Empire, Prussia, Poland, Turkey, and Italy, a manifest advantage arises from the maps of these countries being

drawn on an exactly uniform scale throughout ; and this peculiarity of the present Volume may be referred to with the more satisfaction, as having been attained without the slightest sacrifice of any other quality of utility or interest. With a similar purpose, the maps of Scotland and Ireland, and those of North and South America, are respectively constructed on the same scale of dimensions, and will, therefore, in a similar manner, bear the application of linear measurements from the one to the other

In conclusion, the Author has to observe that, small as the present Volume is, its preparation has involved an amount of personal labour and superintendence which can only be duly appreciated by those who have been engaged in similar undertakings. Of the many thousand names which the work contains, there is not one that has been written without a definite purpose in view, nor without its serving to indicate some fact, either of geographical or historical value. As no expense has been spared by the Publishers in their endeavours to make it in every way equal to the present advanced state of Geographical Science, so they earnestly trust it will be found permanently calculated to render useful service in the task of carrying out the great objects of Education.

W. HUGHES.

LIST OF ABBREVIATIONS AND FOREIGN NAMES USED IN THE MAPS.

B.	- - -	Bay.	Mth.	- - -	Mouth.
